

Assumptions:

1. Each trip only has one start location and one end location.
2. New drivers in the company must have finished at least one training module.
3. Each driver speaks at least one language.
4. Every official prefers only one language.
5. When booking a trip, the features of the vehicle may be sometimes considered.
6. Features are decided by models of one make

Things need to be aware of:

1. As the first model we created has some drawbacks, we improved it later, so there are two outputs in the FIT9132Output.txt, the first one is for the original one, there are no errors but it might have some requirements not covered. The second output is from our final SQL file, but it causes errors because tables and keys are already created in the first running of original SQL file.

Anyway, the logical model is up-to-date, the SQL file and others are also the final ones.

2. The model can only be opened from File → Data Modeler → open, Otherwise, the legend is not visible.
